INTERNATIONAL APPLICATION PUBLISHED UNDER THE PATENT COOPERATION TREATY (PCT)

(51) International Patent Classification ⁶ : A61K 38/00, 39/385, 45/00, 45/05, C07K 7/00, 14/00, 14/82	A1	(11) International Publication Number: WO 96/10413 (43) International Publication Date: 11 April 1996 (11.04.96)
(21) International Application Number: PCT/US95/12463 (22) International Filing Date: 27 September 1995 (27.09.95) (30) Priority Data: 08/315,961 30 September 1994 (30.09.94) US (71) Applicant: LUDWIG INSTITUTE FOR CANCER RE- SEARCH [CH/US]; 1345 Avenue of the Americas, New York, NY 10105 (US). (72) Inventors: VAN DER BRUGGEN, Pierre; UCL 7459, Avenue Hippocrate 74, B-1200 Brussels (BE). BOON-FALLEUR, Thierry; UCL 7459, Avenue Hippocrate 74, B-1200 Brussels (BE). VAN DEN EYNDE, Benoit; UCL 7459, Avenue Hippocrate 74, B-1200 Brussels (BE). (74) Agent: HANSON, Norman, D.; Felfe & Lynch, 805 Third Avenue, New York, NY 10022 (US).		(81) Designated States: AU, CA, CN, FI, JP, NO, NZ, European patent (AT, BE, CH, DE, DK, ES, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE). Published <i>With international search report. Before the expiration of the time limit for amending the claims and to be republished in the event of the receipt of amendments.</i>
(54) Title: COMPOSITIONS CONTAINING TUMOR REJECTION ANTIGEN PRECURSORS OR TUMOR REJECTION ANTIGENS, AND AN ADJUVANT AND/OR GROWTH FACTOR (57) Abstract Compositions with improved immunogenic effect are disclosed. The compositions contain one or more peptides which, when complexed with a cell surface molecule, such as an MHC, HLA or B cell receptor, provoke an immune response. The compositions contain adjuvants such as saponins, which potentiate the immune response. Especially preferred are compositions which stimulate cytolytic T cell responses, such as peptides which satisfy criteria for MHC binding, such as peptides derived from tumor rejection antigen precursors, including MAGE, BAGE, and GAGE derived peptides.

COMPOSITIONS CONTAINING TUMOR REJECTION ANTIGEN
PRECURSORS OR TUMOR REJECTION ANTIGENS,
AND AN ADJUVANT AND/OR GROWTH FACTOR

RELATED APPLICATIONS

This application is a continuation in part of all of the following applications, each of which discuss the provocation of cytolytic T cells in the presence of complexing tumor rejection antigens and MHC/HLA molecules: PCT application PCT/US92/04354 (designating the United States); Serial No. 938,334, filed August 31, 1992; Serial No. 008,446, filed January 22, 1993; Serial No. 54,714, filed April 28, 1993; Serial No. 203,054, filed February 28, 1994; Serial No. 233,305, filed April 26, 1994; Serial No. 195,186, filed February 14, 1994; Serial No. 196,630, filed February 15, 1994; Serial No. 32,978, filed March 18, 1993; Serial Nos. 217,186; 217,187; and 217,188, all of which were filed on March 24, 1994; Serial No. 190,411, filed on April 1, 1994 and Serial No. 253,503, filed June 3, 1994.

FIELD OF THE INVENTION

This invention relates to compositions useful in the generation of an immune response against the classes of molecules referred to as tumor rejection antigen precursors ("TRAPs") and tumor rejection antigens ("TRAs"). The immune response includes, inter alia, the production of antibodies against the TRAPs and TRAs, as well as T cells specific for complexes of TRA and major histocompatibility molecules ("MHCs"). Such T cells and antibodies may be generated, e.g., in a mouse, rat, rabbit, sheep, goat or other non-human animal, and then used in diagnostic methods to identify tumor presence. The compositions may also be used, therapeutically, via administration to a subject afflicted with a cancerous condition or one where cell transformation has taken place, such as melanoma or dysplastic nevi, to provoke an

5 immune response against tumors, cancer cells, and transformed cells.

BACKGROUND AND PRIOR ART

10 The study of the recognition or lack of recognition of cancer cells by a host organism has proceeded in many different directions. Understanding of the field presumes some understanding of both basic immunology and oncology.

15 Early research on mouse tumors revealed that these displayed molecules which led to rejection of tumor cells when transplanted into syngeneic animals. These molecules are "recognized" by T-cells in the recipient animal, and provoke a cytolytic T-cell response with lysis of the transplanted cells. This evidence was first obtained with tumors induced in vitro by chemical carcinogens, such as methylcholanthrene. 20 The antigens expressed by the tumors and which elicited the T-cell response were found to be different for each tumor. See Prehn, et al., J. Natl. Canc. Inst. 18: 769-778 (1957); Klein et al., Cancer Res. 20: 1561-1572 (1960); Gross, Cancer Res. 3: 326-333 (1943), Basombrio, Cancer Res. 30: 2458-2462 (1970) 25 for general teachings on inducing tumors with chemical carcinogens and differences in cell surface antigens. This class of antigens has come to be known as "tumor specific transplantation antigens" or "TSTAs". Following the observation of the presentation of such antigens when induced 30 by chemical carcinogens, similar results were obtained when tumors were induced in vitro via ultraviolet radiation. See Kripke, J. Natl. Canc. Inst. 53: 333-1336 (1974).

35 While T-cell mediated immune responses were observed for the types of tumor described supra, spontaneous tumors were thought to be generally non-immunogenic. These were therefore believed not to present antigens which provoked a response to the tumor in the tumor carrying subject. See Hewitt, et al., Brit. J. Cancer 33: 241-259 (1976).

40 The family of tumor antigen presenting cell lines are immunogenic variants obtained by mutagenesis of mouse tumor cells or cell lines, as described by Boon et al., J. Exp. Med.

5 152: 1184-1193 (1980), the disclosure of which is incorporated by reference. To elaborate, tum⁻ antigens are obtained by mutating tumor cells which do not generate an immune response in syngeneic mice and will form tumors (i.e., "tum⁺" cells). When these tum⁺ cells are mutagenized, they are rejected by
10 syngeneic mice, and fail to form tumors (thus "tum⁻"). See Boon et al., Proc. Natl. Acad. Sci. USA 74: 272 (1977), the disclosure of which is incorporated by reference. Many tumor types have been shown to exhibit this phenomenon. See, e.g., Frost et al., Cancer Res. 43: 125 (1983).

15 It appears that tum⁻ variants fail to form progressive tumors because they elicit an immune rejection process. The evidence in favor of this hypothesis includes the ability of "tum⁻" variants of tumors, i.e., those which do not normally form tumors, to do so in mice with immune systems suppressed
20 by sublethal irradiation, Van Pel et al., Proc. Natl. Acad. Sci. USA 76: 5282-5285 (1979); and the observation that intraperitoneally injected tum⁻ cells of mastocytoma P815 multiply exponentially for 12-15 days, and then are eliminated in only a few days in the midst of an influx of lymphocytes
25 and macrophages (Uyttenhove et al., J. Exp. Med. 152: 1175-1183 (1980)). Further evidence includes the observation that mice acquire an immune memory which permits them to resist subsequent challenge to the same tum⁻ variant, even when immunosuppressive amounts of radiation are administered with
30 the following challenge of cells (Boon et al., Proc. Natl. Acad. Sci. USA 74: 272-275 (1977); Van Pel et al., supra; Uyttenhove et al., supra). Later research found that when spontaneous tumors were subjected to mutagenesis, immunogenic variants were produced which did generate a response. Indeed,
35 these variants were able to elicit an immune protective response against the original tumor. See Van Pel et al., J. Exp. Med. 157: 1992-2001 (1983). Thus, it has been shown that it is possible to elicit presentation of a so-called "tumor rejection antigen" in a tumor which is a target for a
40 syngeneic rejection response. Similar results have been obtained when foreign genes have been transfected into

5 spontaneous tumors. See Fearson et al., Cancer Res. 48: 2975-1980 (1988) in this regard.

A class of antigens has been recognized which are presented on the surface of tumor cells and are recognized by cytotoxic T cells, leading to lysis. This class of antigens will be referred to as "tumor rejection antigens" or "TRAs" hereafter. TRAs may or may not elicit antibody responses. The extent to which these antigens have been studied, has been via cytolytic T cell characterization studies in vitro i.e., the study of the identification of the antigen by a particular cytolytic T cell ("CTL" hereafter) subset. The subset proliferates upon recognition of the presented tumor rejection antigen, and the cells presenting the antigen are lysed. Characterization studies have identified CTL clones which specifically lyse cells expressing the antigens. Examples of this work may be found in Levy et al., Adv. Cancer Res. 24: 1-59 (1977); Boon et al., J. Exp. Med. 152: 1184-1193 (1980); Brunner et al., J. Immunol. 124: 1627-1634 (1980); Maryanski et al., Eur. J. Immunol. 124: 1627-1634 (1980); Maryanski et al., Eur. J. Immunol. 12: 406-412 (1982); Palladino et al., Canc. Res. 47: 5074-5079 (1987). This type of analysis is required for other types of antigens recognized by CTLs, including major histocompatibility antigens, the male specific H-Y antigens, and a class of antigens, referred to as "tum-" antigens, and discussed herein.

30 A tumor exemplary of the subject matter described supra is known as P815. See DePlaen et al., Proc. Natl. Acad. Sci. USA 85: 2274-2278 (1988); Szikora et al., EMBO J 9: 1041-1050 (1990), and Sibille et al., J. Exp. Med. 172: 35-45 (1990), the disclosures of which are incorporated by reference. The P815 tumor is a mastocytoma, induced in a DBA/2 mouse with methylcholanthrene and cultured as both an in vitro tumor and a cell line. The P815 line has generated many tum⁻ variants following mutagenesis, including variants referred to as P91A (DePlaen, supra), 35B (Szikora, supra), and P198 (Sibille, supra). In contrast to tumor rejection antigens - and this is a key distinction - the tum⁻ antigens are only present after

5 the tumor cells are mutagenized. Tumor rejection antigens are present on cells of a given tumor without mutagenesis. Hence, with reference to the literature, a cell line can be tum⁺, such as the line referred to as "P1", and can be provoked to produce tum⁻variants. Since the tum⁻ phenotype differs from
10 that of the parent cell line, one expects a difference in the DNA of tum⁻ cell lines as compared to their tum⁺ parental lines, and this difference can be exploited to locate the gene of interest in tum⁻ cells. As a result, it was found that genes of tum⁻ variants such as P91A, 35B and P198 differ from
15 their normal alleles by point mutations in the coding regions of the gene. See Szikora and Sibille, supra, and Lurquin et al., Cell 58: 293-303 (1989). This has proved not to be the case with the TRAs of this invention. These papers also demonstrated that peptides derived from the tum⁻ antigen are
20 presented by the L^d molecule for recognition by CTLs. P91A is presented by L^d, P35 by D^d and P198 by K^d.

Prior patent applications PCT/US92/04354, U.S. Serial No. 807,043; 764,364; 728,838 and 705,702, all of which are incorporated by reference and U.S. Patent No. 5,342,774,
25 describe inventions involving, inter alia, genes and other nucleic acid molecules which code for various TRAPs, which are in turn processed to tumor rejection antigen, or "TRAs". SEQ ID NOS: 1-26 which are a part of the subject application present sequences of genes coding for various TRAPs, and the
30 TRA referred to hereafter as MZ2E, which is derived from MAGE-1 TRAP (SEQ ID NO: 26).

The genes are useful as a source for the isolated and purified tumor rejection antigen precursor and the TRA themselves, either of which can be used as an agent for
35 treating the cancer for which the antigen is a "marker", as well as in various diagnostic and surveillance approaches to oncology, discussed infra. It is known, for example, that tum⁻ cells can be used to generate CTLs which lys cells presenting different tum⁻ antigens as well as tum⁺ cells. See,
40 e.g., Maryanski et al., Eur. J. Immunol 12: 401 (1982); and Van den Eynde et al., Modern Trends in Leukemia IX (June

5 1990), the disclosures of which are incorporated by reference. The tumor rejection antigen precursor may be expressed in cells transfected by the gene, and then used to generate an immune response against a tumor of interest.

10 In the parallel case of human neoplasms, it has been observed that autologous mixed lymphocyte-tumor cell cultures ("MLTC" hereafter) frequently generate responder lymphocytes which lyse autologous tumor cells and do not lyse natural killer targets, autologous EBV-transformed B cells, or autologous fibroblasts (see Anichini et al., Immunol. Today 8: 15 385-389 (1987)). This response has been particularly well studied for melanomas, and MLTC have been carried out either with peripheral blood cells or with tumor infiltrating lymphocytes. Examples of the literature in this area including Knuth et al., Proc. Natl. Acad. Sci. USA 86: 2804- 20 2802 (1984); Mukherji et al., J. Exp. Med. 158: 240 (1983); Hérin et al., Int. J. Canc. 39: 390-396 (1987); Topalian et al., J. Clin. Oncol 6: 839-853 (1988). Stable cytolytic T cell clones have been derived from MLTC responder cells, and these clones are specific for the tumor cells. See Mukherji et al., 25 supra, Hérin et al., supra, Knuth et al., supra. The antigens recognized on tumor cells by these autologous CTLs do not appear to represent a cultural artifact, since they are found on tumor cells in vivo. Topalian et al., supra; Degiovanni et al., Eur. J. Immunol. 20: 1865-1868 (1990). These 30 observations, coupled with the techniques used herein to isolate the genes for specific murine tumor rejection antigen precursors, have led to the isolation of nucleic acid sequences coding for tumor rejection antigen precursors of TRAs presented on human tumors. It is now possible to isolate 35 the nucleic acid sequences which code for tumor rejection antigen precursors, including, but not being limited to those most characteristic of a particular tumor, with ramifications that are described infra.

40 Additional work has focused upon the presentation of TRAs by the class of molecules known as major histocompatibility complexes, or "MHCs". Human forms of these molecules are

5 "human leukocyte antigens" or "HLAs". This work has resulted
in several unexpected discoveries regarding the field.
Specifically in U.S. patent application Serial Number 938,334,
now U.S. Patent No. _____ the disclosure of which is
10 incorporated by reference, nonapeptides are taught which are
presented by the HLA-A1 molecule. The reference teaches that
given the known specificity of particular peptides for
particular HLA molecules, one should expect particular
peptides to bind one HLA molecule. These peptides, presented
15 herein as SEQ ID NOS: 27-34 are also presented in Traversari
et al., J. Exp. Med. 176: 1453-1457 (1992). This is
important, because different individuals possess different HLA
phenotypes. As a result, while identification of particular
peptides or of particular motifs, and the peptides which are
members thereof, as being partners for a specific HLA molecule
20 has diagnostic and therapeutic ramifications, these are only
relevant for individuals with that particular HLA phenotype.
There is a need for further work in the area, because cellular
abnormalities are not restricted to one particular HLA
phenotype, and targeted therapy requires some knowledge of the
25 phenotype of the abnormal cells at issue.

In U.S. Patent Application Serial Number 008,446, filed
January 22, 1993 and incorporated by reference, the fact that
the MAGE-1 expression product is processed to a second TRA is
disclosed. This second TRA is presented by HLA-Cw* 1601
30 molecules. The disclosure shows that a given TRAP can yield
a plurality of TRAs.

In U.S. Patent Application Serial Number 994,928, filed
December 22, 1992, and incorporated by reference herein,
tyrosinase is described as a tumor rejection antigen
precursor. This is a well known molecule as per Kwon, U.S.
35 Patent No. 4,898,814. This reference discloses that a
molecule which is produced by some normal cells (e.g.,
melanocytes), is processed in tumor cells to yield a tumor
rejection antigen that is presented by HLA-A2 molecules. The
peptide presented thereby is described in U.S. Application
40 Serial No. 54,714, filed April 28, 1993. SEQ ID NO: 35 sets

5 forth this peptide. Additional tyrosinas derived peptides presented by HLA molecules are set forth in Serial Nos. 203,054, and 233,305 filed February 28, 1994 and April 26, 1994 and incorporated by reference (SEQ ID NOS: 36-41).

10 Other peptides which are TRAs are described in additional patent applications. U.S. Patent Application Serial No. 195,186, filed February 14, 1994, and incorporated by reference herein, sets forth three peptides (SEQ ID NOS: 42-44 herein), which are derived from MAGE-1 and which complex with HLA-Cw* 1601. Serial No. 196,630, filed February 15, 1994,
15 discloses an unrelated tumor rejection antigen precursor, the so-called "BAGE" gene, and peptides derived therefrom, which are processed and then presented by HLA-Cw* 1601. These are set forth as SEQ ID NOS: 45-48, and this application is incorporated by reference. SEQ ID NO: 48 is the tumor
20 rejection antigen. Additional coding sequences for a tumor rejection antigen precursor are set forth in Serial No. 32,978, filed March 18, 1993 and incorporated by reference. These are included herein as SEQ ID NOS: 49 and 50. A more extended sequence for this gene is set forth in Serial No.
25 272,351, filed July 8, 1994 incorporated by reference, and is SEQ ID NO: 51. In Serial No. 96,039, filed July 22, 1993, the sequence of tumor rejection antigen precursor GAGE is set forth. See SEQ ID NO: 52 for this information.

30 A series of peptides which provoke lysis by cytolytic T cells when presented by MHC molecules are set forth in Serial No. 217,186, Serial No. 08/217,188, and Serial No. 217,187, all filed on March 24, 1994, and all of which are incorporated by reference herein. The first of these applications discloses MAGE-3 derived peptides presented by HLA-A2. Five
35 peptides are of interest. These are repeated here as SEQ ID NOS: 53-57. The second application presents 11 sequences derived from MAGE-2, believed to complex with HLA-A2.1 molecules (SEQ ID NOS: 58-68). The last of these applications discloses two additional peptides (SEQ ID NOS: 69 and 70)
40 derived from MAGE-3 which complex to HLA-A2. Serial No. 190,411, filed April 1, 1994 and incorporated by reference,

5 sets forth three peptides (SEQ ID NO: 71-73), derived from
MAGE-1, which are immunogenic in that they provoke production
of antibodies in a host animal to which they have been
administered. Serial No. 253,503, filed June 3, 1994 and
10 incorporated by reference, teaches a further tumor rejection
antigen precursor gene (SEQ ID NO:74), and a peptide, derived
therefrom (SEQ ID NO:75), which is presented by HLA-B44
molecules. Further in the application of Coulie, Ikeda and
Boon-Falleur, filed concurrently, a sequence coding for a
15 tumor rejection antigen precursor known as DAGE (SEQ ID NO:76)
is set forth. DAGE is found almost universally on tumor
cells, and only on testis cells with respect to normal cell
expression. This makes it especially useful for cancer
diagnosis and in the applications disclosed herein. The above
20 listing should not be presumed to be exhaustive of the TRAP
and TRA literature, but is presented to show its diversity and
the fact that these materials not only provoke T cell
proliferation, but also stimulate production of antibodies.
It is well known that antibody producing cells can be used as
a source to produce hybridomas, which in turn produce
25 monoclonal antibodies. Thus, when the term "antibodies" is
used herein, it encompasses both polyclonal and monoclonal
antibodies.

The parent applications to the present case, including
Serial No. 142,368 and Serial No. 190,411, both discuss the
30 usefulness of combining TRAPs or TRAs with various materials
as adjuvants, to produce vaccines, immunogenic compositions,
etc. Adjuvants, broadly defined, are substances which promote
immune responses. Frequently, the adjuvant of choice is
Freund's complete adjuvant, or killed B. pertussis organisms,
35 used in combination with alum precipitated antigen. A general
discussion of adjuvants is provided in Goding, Monoclonal
Antibodies: Principles & Practice (Second edition, 1986), at
pages 61-63, which are incorporated by reference herein.
Goding notes, however, that when the antigen of interest is of
40 low molecular weight, or is poorly immunogenic, coupling to an
immunogenic carrier is recommended. Such molecules, according

5 to Goding, generally have molecular weights below about 1000. Among the carriers suggested by Goding, at page 283, are keyhole limpet hemocyanin, bovine serum albumin, ovalbumin, and fowl immunoglobulin.

10 What is problematic about such carriers, however, is that frequently they are also immunogenic themselves. Thus, the immune response may be a general one, with part, most, or all of it being directed against the carrier molecule rather than the immunogen itself.

15 Exemplary of developments in the art as they relate to adjuvants is U.S. Patent No. 5,057,540 to Kensil, et al, the disclosure of which is incorporated by reference herein. Kensil et al disclose the preparation of various saponin extracts, which are useful as adjuvants in immunogenic compositions. As natural products, the extracts are not
20 completely defined. Kensil, et al do provide a complete and enabling disclosure for how various extracts, including QA-7, QA-19, and QA-21 (also referred to as QS-21) are prepared. Experiments are set forth in which bovine serum albumin ("BSA") was combined with various extracts (examples 8 and 9),
25 and where feline leukemia virus recombinant glycoprotein "gp70RA" was tested, following absorption to aluminum hydroxide (alum). The two immunogens tested, however, are expected to be immunogenic in their own right (gp70RA has a molecular weight of 70 kd, and serum albumin has about the same
30 molecular weight). No experiments were carried out at all on molecules which should, per se, be considered to be poorly or even non-immunogenic, and thus would be expected to require the use of alum absorption or the use of haptenic carriers for provocation of a response.

35 In PCT Application WO9219758, which corresponds to defensive publication 7697275, which is incorporated by reference herein, an adjuvant referred to as "MTP-MF59" is disclosed. This adjuvant is used in connection with a Plasmodium falciparum protein, "Pfs-25-B". This combination
40 is described as a transmission blocking vaccine. The P. falciparum protein is itself large enough to be immunogenic.

5 Thus, none of the art shows that the improved adjuvants can be used in combination with presumptively non-immunogenic proteins and peptides to yield immunologically effective compositions. This is especially true for TRAP and TRA molecules, as outlined supra.

10 It has now been found, surprisingly, that compositions comprising tumor rejection antigen precursors or tumor rejection antigens can be made which, when administered to a subject animal, provoke an immunogenic response. In especially preferred embodiments the immunogenic portion of the composition consists of TRAP or, more preferably TRA
15 molecules, of one or more types, and an adjuvant. Especially preferred are compositions where the adjuvant is QS21, as is disclosed in the Kensil, et al patent, incorporated by reference supra.

20 The immunogens of this invention consist of TRAPs or TRAs, meaning that they do not include haptens, carriers, precipitated alum, or any of the materials normally associated with materials which are or are expected to be poorly immunogenic. In especially preferred embodiments, the
25 compositions consist essentially of the immunogen and the adjuvant.

The invention is described in greater detail in the disclosure which follows.

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

Example

30 The following example demonstrates the use of peptide MZ2E (SEQ ID NO: 26) in connection with adjuvant QS-21. It is to be understood, however, that one may routinely substitute proteins or peptides (the first component of the composition) and adjuvants (the second component of the composition). The
35 unexpected effect of the combination of MZ2E and QS21 should occur in the alternate combinations, i.e., when other peptides are used.

40 Subjects tested are patients with stage IV melanoma or high risk stage III malignant melanoma. Stage IV patients have a median survival time of one year following diagnosis,

5 and only a 15% chance of long-term survival (Balch, et al, Cutaneous Melanoma, J.b. Lippincott, Philadelphia, 1992). The standard therapy for these patients includes treatment with decarbazine or drug combinations with decarbazine; however, response rates only range from 8-25%, and there is no evidence
10 of the treatment extending survival. Balch et al, supra. Patients with high risk Stage III melanoma (pT4 thick truncal primary tumors or extremity melanomas, with five or more positive regional lymph nodes) have a median survival of 1-2 years following onset, and a 19% chance of long term survival.
15 Balch, et al, supra.

Twelve patients are used in the study, all of whom have either Stage IV or high risk Stage III malignant melanoma in accordance with the criteria provided supra, confirmed by review of histology.

20 The patients fulfil the following additional criteria:

- (i) complete recovery from surgery;
- (ii) no chemotherapy or immunotherapy, within the four weeks preceding immunization;
- (iii) expected survival of at least three months;
- 25 (iv) Karnofsky Performance Status of 60 or more;
- (v) Laboratory results as follows:
 - granulocytes \geq 2,500/min³
 - lymphocytes \geq 700/min³
 - platelets \geq 100,000/min³
 - 30 serum creatinine \leq 2.0 mg/100 ml
 - serum bilirubin \leq 2.0 mg/100 ml
- (vi) for MZ2E immunization, patients are positive for HLA-A1;
- (vii) for MZ2E immunization, the patients' tumors express
35 MAGE-1;
- (viii) they be over 19 years old and be capable of giving informed consent in writing.

Any potential subjects who satisfy any of the following
40 criteria are excluded:

- (i) clinically significant heart disease;

5 (ii) other serious illness, such as active infection
requiring antibiotics, or bleeding disorders;

(iii) treatment with antihistamines, N-SAIDS, or corti-
costeroids;

10 (iv) immunodeficiency, splenectomy, or radiation therapy
to the spleen;

(v) pregnancy or lactation;

(vi) women of childbearing age who do not use effective
methods of contraception.

15 All subjects are treated as outpatients. They are immunized,
subcutaneously, with MZ2E (30 ug or 300 ug) and QS21 (100 ug),
in 0.3 ml phosphate buffered saline, pH 7.4. Six patients
receive 30 ug of peptide, and six receive 300 ug. The first
20 injection is into the deltoid region of the anterior aspect of
the thigh, and the site of injection is changed with follow up
injections. No injections are given into limbs where draining
lymph nodes have been surgically removed or irradiated.

25 Injections are given at day 1, and then at days 8, 15,
22, and 57. Patients are monitored over a course of 12 weeks,
unless intervention is required (as determined by the
investigator). Any patients who show stabilization or tumor
response remain in the study until disease progression is
evidenced. Patients may also be removed from the study or
receive different doses of the peptide, if toxicity reactions
30 are observed.

The patients show response as follows. In a complete
response, all signs, symptoms, biochemical and imaging
evidence of tumor disappear for a period of at least 30 days.
In a partial response, there is a decrease in size of all
35 measurable tumors of at least 50% of the sum of products of
the greatest and perpendicular diameters for at least 30 days,
without the appearance of new lesions or progression of any
new lesions. In a minor response, there is a decrease in size
of all measurable tumors of at least 25% of the sum of
40 products of gr atest and perpendicular diameters, for at least
30 days, without appearance of new lesions or progression of

5 any lesion. In stable disease, there is a change of less than
25% of the sum of products of greatest and perpendicular
diameters, for at least 30 days, without the appearance of new
lesions or progression of lesions. In progression of the
10 the size of measurable tumors of at least 50% of the sum of
the product of greatest and perpendicular diameter.

The foregoing example demonstrates a composition
comprising an amount of a tumor rejection antigen, i.e., MZ2E,
and an adjuvant, i.e., QS21, and the use of the composition in
15 the in vivo treatment of cancer (i.e., melanoma). The tumor
rejection antigen is used in an amount sufficient to provoke
an immune response against tumor cells which present it on
their surface.

The compositions of the invention comprise any tumor
20 rejection antigen precursor ("TRAP") or tumor rejection
antigen ("TRA"), in combination with a pharmaceutically
acceptable adjuvant. Preferred embodiments of the invention
utilize the TRAPs and TRAs discussed supra and set forth in
SEQ ID NO: 65, as well as the adjuvants described in the
25 Background section.

As will be seen from the foregoing discussion, an
important aspect of the invention is stimulation of
proliferation of T cells. This can be an initial stimulation
or an augmentation of a prior stimulation. In particular, it
30 is desirable to stimulate cytolytic T cells which present
peptides, such as the TRAs described herein, on their
surfaces. The cytolytic T cells recognize these complexes of
MHC and peptide, bind thereto via their receptor, and
proliferate. They also lyse the recognized cells. This
35 response can be used not only in vivo, but in vitro, as it is
well established that cytolytic T cells specific for
particular complexes of MHC and peptide are present in the
blood of subjects who have experienced cell transformation.
By contacting a blood sample of individuals in vitro with the
40 peptide of interest and cells which present the MHC molecule
of interest, any cytolytic T cells in the blood sample will

5 expand, i.e., proliferate. This proliferation can be measured via any of the well known assays designed therefor. Especially preferred are the radioactive chromium (^{51}Cr) release assay, and the measurement of release of tumor necrosis factor (TNF).

10 The compositions are also useful as stimulators of B cell proliferation, or antibody production. Again, it is well known that B cells produce antibodies, and the size of their targets are well within the sizes of the tumor rejection antigens, and certainly the tumor rejection antigen precursors. As with T cells, the stimulation may be "ab initio", or an augmentation of a prior response, in vitro or in vivo.

15 The amount of TRAP or TRA used will vary, depending upon the purpose of the immunization and the subject to which it is administered. For example, in the case of generating murine antibodies which can then be used, e.g., to diagnose for the presence of cancer cells presenting a TRA, the amount of protein or peptide may be less than that used in a course of in vivo therapy, such as that described in the example, supra.

20 In general, a preferred dose can range from about 1 ug to about 750 ug of protein or peptide per dose. In a preferred embodiment, the range is from about 10 ug to about 500 ug. Most preferably, anywhere from about 30 ug to about 300 ug per dose may be used. Of course, in the context of the therapeutic aspect of the invention, the investigator will modify the dose, as a six month old infant will require dosing different from a full grown man, e.g. The mode of administration may vary, with preferred forms being oral, subcutaneous, intramuscular, intravenous and intraperitoneal

25 administration.

30 The choice of TRAP or TRA protein or peptide in the composition will depend upon parameters determinable by the artisan. It is art recognized, for example, that different TRAs are presented by the various MHC molecules. As such, if a subject is typed, using well known techniques, as presenting HLA-A2 molecules on the surface of tumor cells, one will use

35

40

5 a TRA presented by HLA-A2 molecules rather than one presented
by, e.g., HLA-Cw* 1601. Similarly, using techniques such as
polymerase chain reaction ("PCR"), lysis studies, and other
assay methodologies which are well known in the art, one can
determine which tumor rejection antigen precursor gene or
10 genes are being expressed by a subject patient. This will
lead to the decision as to what protein or peptide to use.
Again, by way of example, if a subject's tumor cells are
expressing MAGE-3 but not MAGE-1, the peptide used in
immunization should be derived from MAGE-3, and not MAGE-1.

15 While the molecules discussed herein are referred to as
"tumor" rejection antigens and "tumor" rejection antigen
precursors, it is intended that their use, in a therapeutic
and also a diagnostic context, extends beyond cancer *per se*.
The art is familiar with pathological conditions, such as
20 dysplastic nevis, which are not cancer *per se*, but where the
cells of the afflicted individuals are in fact characterized
by transformation. Any and all such conditions are within the
intended ambit of the invention.

Other aspects of the invention will be clear to the
25 skilled artisan and need not be reiterated here.

The terms and expressions which have been employed are
used as terms of description and not of limitation, and there
is no intention in the use of such terms and expressions of
excluding any equivalents of the features shown and described
30 or portions thereof, it being recognized that various
modifications are possible within the scope of the invention.

We claim:

1. Composition of matter comprising:
 - (i) a tumor rejection antigen precursor or a tumor rejection antigen, and at least one of:
 - (ii) a pharmaceutically acceptable adjuvant, and a T or B cell growth factor.
2. The composition of matter of claim 1, wherein said tumor rejection antigen precursor is a MAGE protein.
3. The composition of matter of claim 1, wherein said tumor rejection antigen precursor is a BAGE protein.
4. The composition of matter of claim 1, wherein said tumor rejection antigen precursor is a GAGE protein.
5. The composition of claim 1, wherein said tumor rejection antigen is derived from a MAGE protein.
6. The composition of matter of claim 5, wherein said MAGE protein is MAGE-1, MAGE-2, or MAGE-3.
7. The composition of matter of claim 6, wherein said tumor rejection antigen consists of one of SEQ ID NO: 1 through SEQ ID NO: 5.
8. The composition of matter of claim 1, wherein said pharmaceutically acceptable adjuvant is a substantially pure saponin derived from Quillaja saponaria.
9. The composition of matter of claim 8, wherein said substantially pure saponin is selected from the group consisting of QA-7, QA-21, QA-17, and QA-18.
10. The composition of matter of claim 1, wherein said pharmaceutically acceptable adjuvant is MTP-MF59.

11. Method for stimulating an immune response in a subject comprising administering the composition of matter of claim 1 to said subject in an amount sufficient to provoke an immune response to said tumor rejection antigen precursor or tumor rejection antigen.

12. The method of claim 11, wherein said immune response comprises proliferation of T cells specific for complexes of said tumor rejection antigen and a major histocompatibility complex molecule to which said tumor rejection antigen binds.

13. The method of claim 11, wherein said T cells are cytolytic T cells.

14. The method of claim 11, wherein said immune response comprises production of antibodies against said tumor rejection antigen precursor or tumor rejection antigen.

15. The composition of claim 1, in intravenous form.

16. The composition of claim 1, in the form of a liposome.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US95/12463

A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) : A61K 38/00, 39/385, 45/00, 45/05; C07K 7/00, 14/00, 14/82

US CL : 424/185.1, 193.1, 277.1; 530/300, 350, 395, 868

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 424/185.1, 193.1, 277.1; 530/300, 350, 395, 868

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Examiner's tumor rejection file references

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

Automated Patent System and DIALOG (file=BIOCHEM). Key words: MAGE, tumor rejection antigen?

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	US, A, 5,342,774 (BOON ET AL) 30 August 1994.	1-16
A, P	US, A, 5,405,940 (BOON ET AL.) 11 April 1995.	1-16
